

Accelerator aims to create more efficient reps

Across the board, the expected outcomes of Accelerator focused on increasing the volume of loads matched per rep.

- "...From 10 loads per rep per day to **20-25 [loads per rep per day]**"
- "Could we increase the **amount of loads an ops person can handle per day?**"
- "Free up **more time to get more business**, both from existing and new customers."
- "Sales reps can **move more loads per person per day** because the system makes them bionic."

Notable outliers:

- "Likely the best outcome would be if carrier sales could **focus on maximizing gross profit** and **understanding the nuances of individual carriers.**"
- "The goal is to **be the easiest to do business with**, which involves having the fewest invoice disputes and requiring the fewest phone calls for update."

The interviews aligned with the roadmap on the importance of sourcing & booking.

As currently prioritized, the roadmap focuses on sourcing more capacity and more efficiently matching it. This reinforces one of the major inputs to the flywheel mechanic. Double-clicking into these processes highlights a multitude of sub-capabilities.

Sourcing capabilities lean more technical, including:

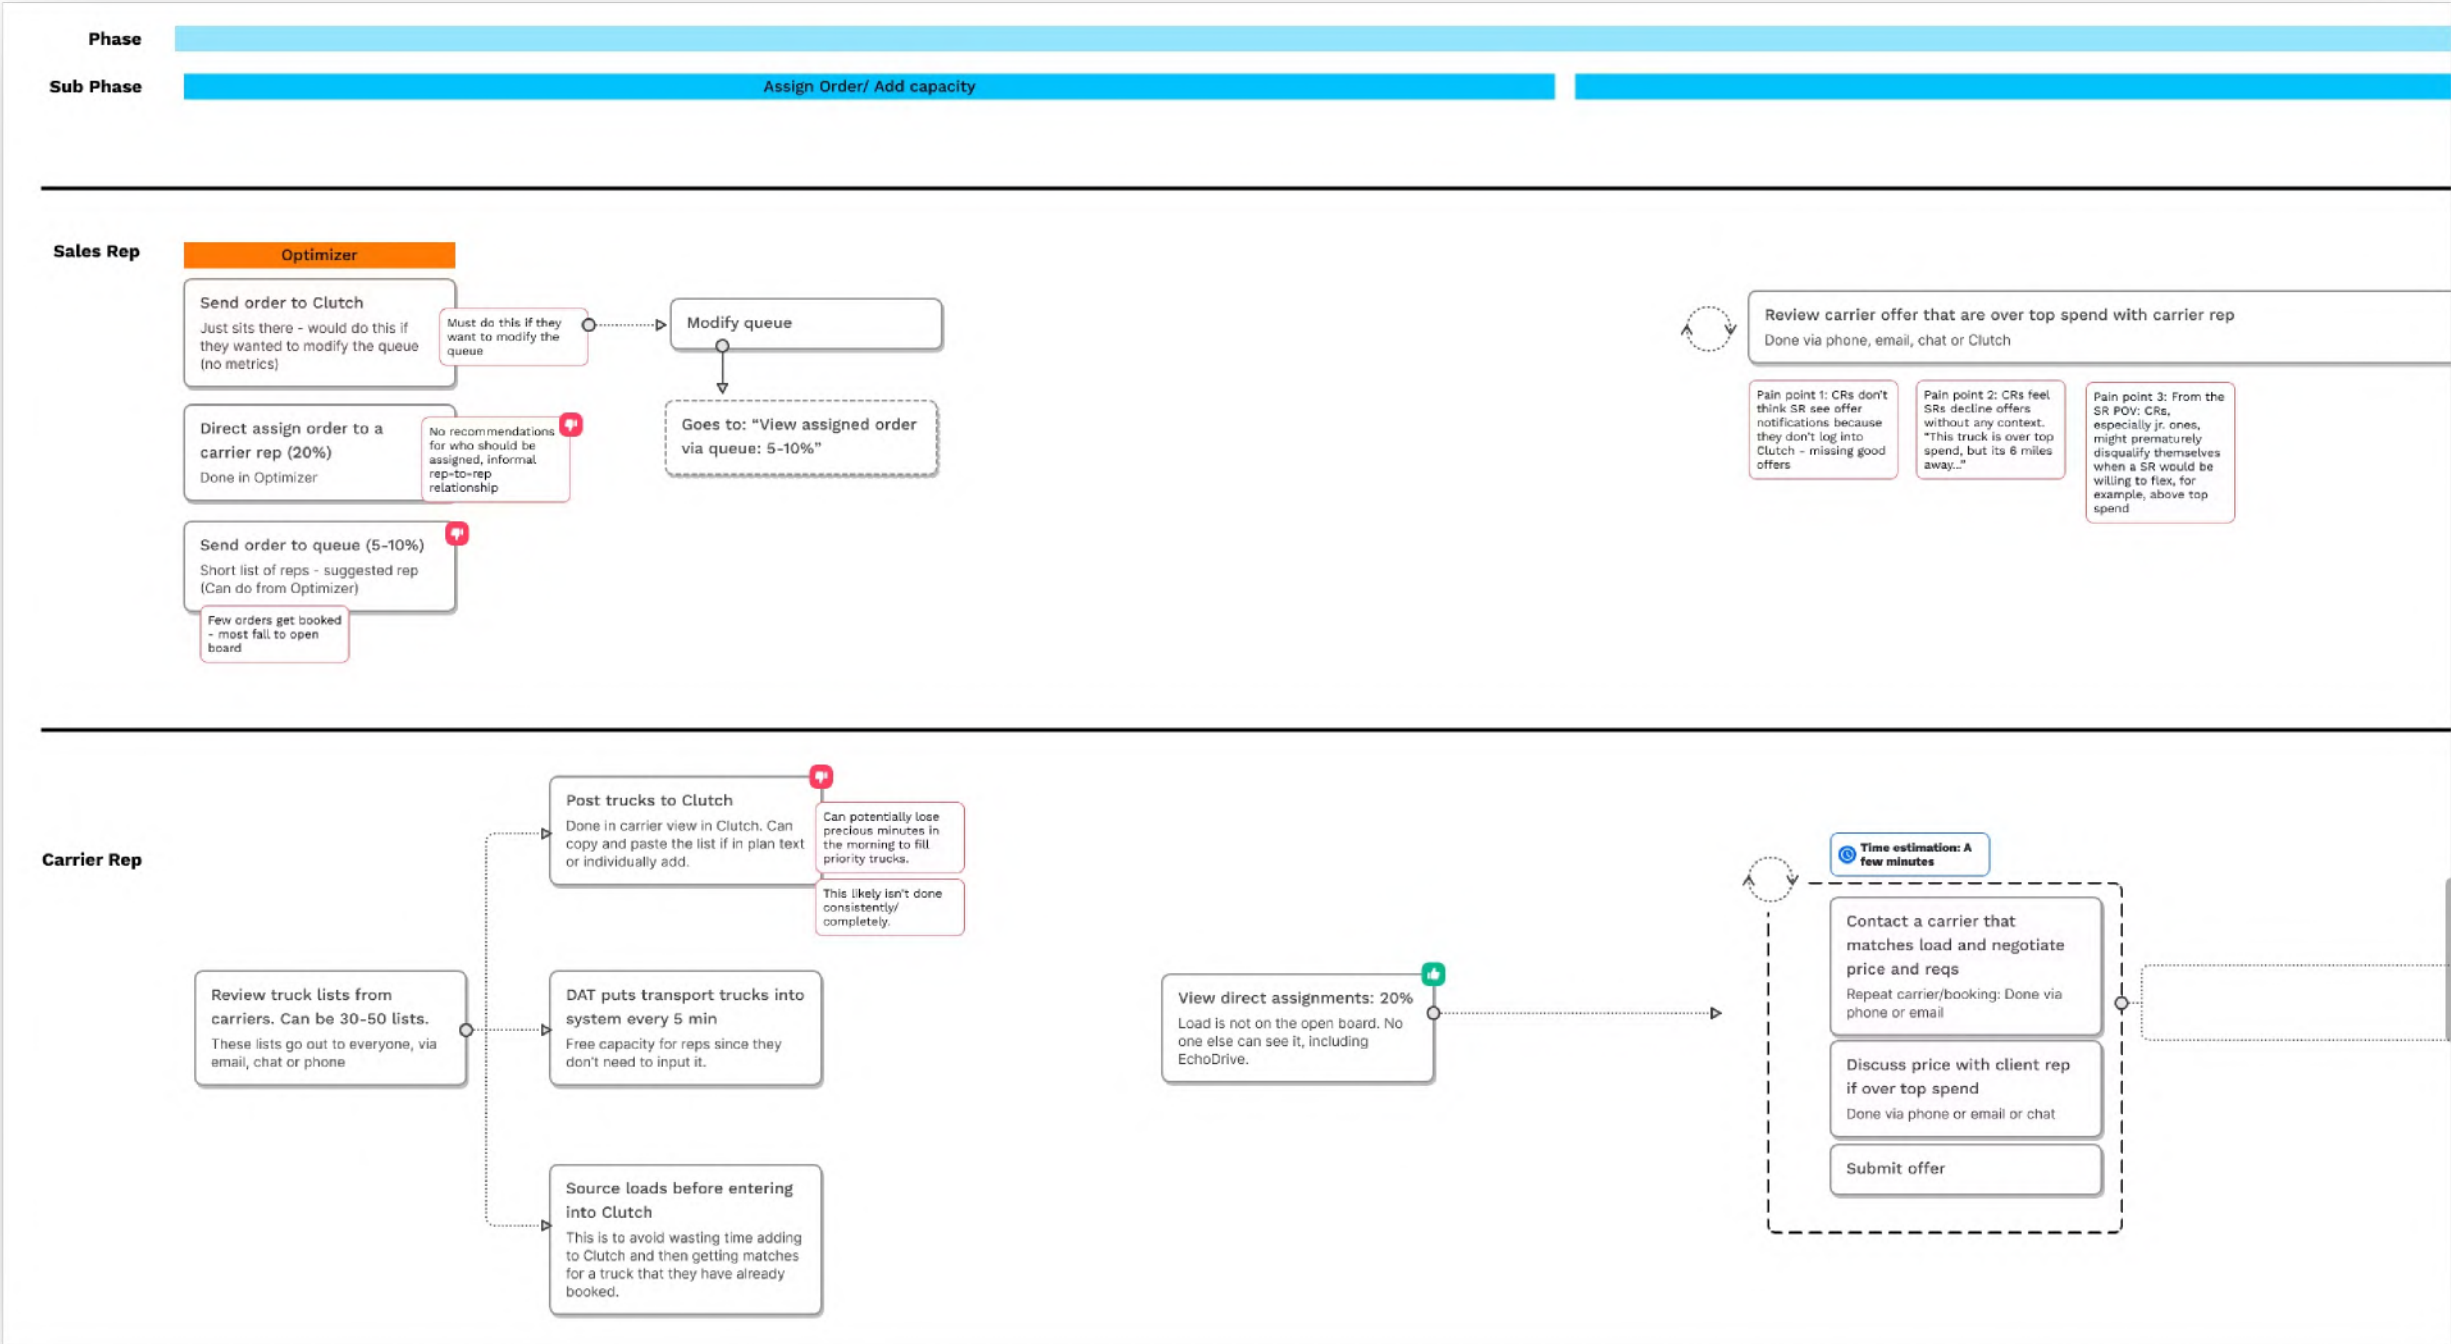

- Aggregating supply across many different channels and sources
- Accepting offers from multiple sources, including automated channels
- Actively accessing "dark" or *implied* capacity

Making matches that lead to bookings has significantly more socio-cultural influences:

- More junior carrier reps disqualifying themselves from otherwise available loads
- Approvals on offers above top spend require back-and-forth between reps
- Workarounds that walk the line between savviness & business risk like accessing potential loads via Stats
- Communication channels that can lead to social loafing, like distribution lists

Sourcing and booking is a recursive, complex process

How can we improve sourcing & booking?

// 5 seconds to wait for a sort [in Stats] feels like an eternity, especially when you're on the phone. //

// Data entry that should be quick is clumsy and cumbersome. //

// We waste time looking through search results for carriers that can't accommodate certain shipper requirements. //

// A future sales rep is more like a CIA agent. If they can get the information nobody else is getting and put that into the system then we can take advantage of carrier capacity or shipments that nobody else is getting. //

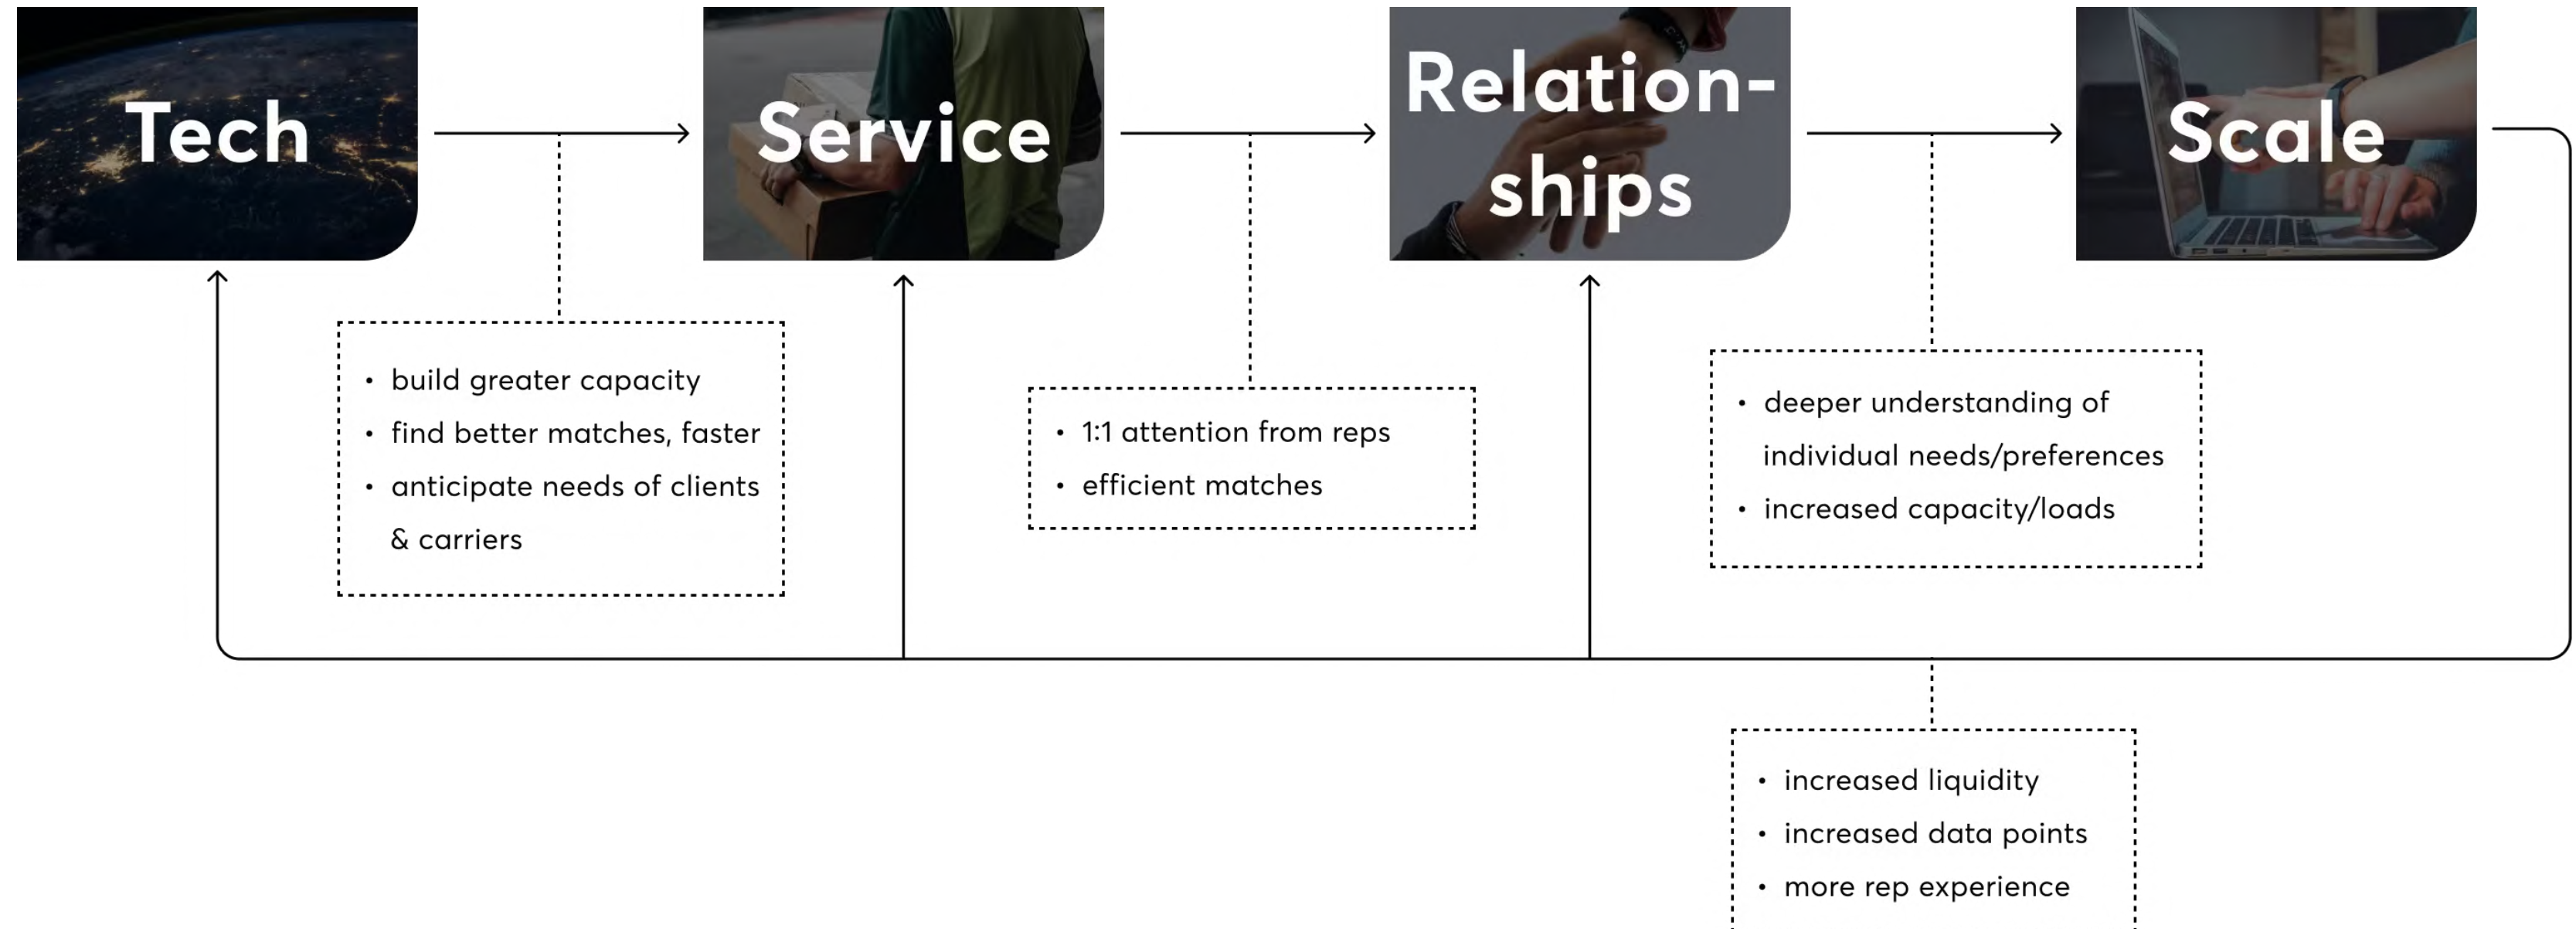

// It's hard to predict the "right" info for each user, so want to empower sorting, filtering, or drilling down quickly. //

// We want to free up time to chase the next load by reducing time it takes to manage current allocation of loads. //

// Another pain point and huge opportunity is not capturing contingent or conditional capacity, which would be a scenario like 'if you can get me loads every Tuesday out of Atlanta, I'll give you 5 trucks every Tuesday out of Atlanta nobody else is getting'. //

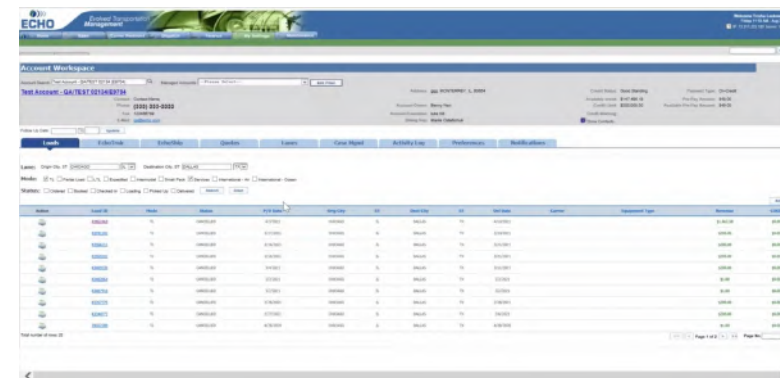

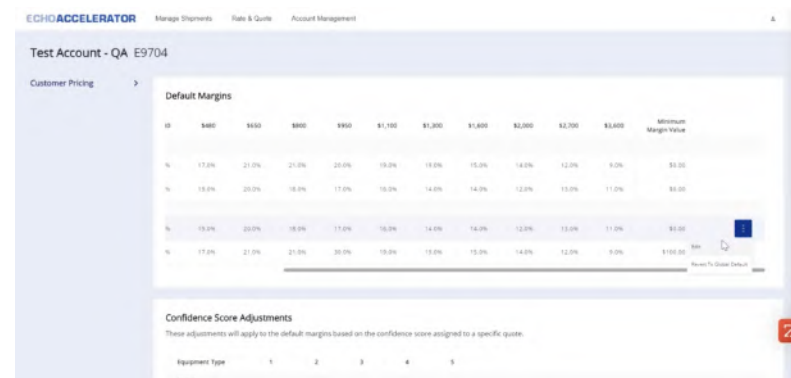

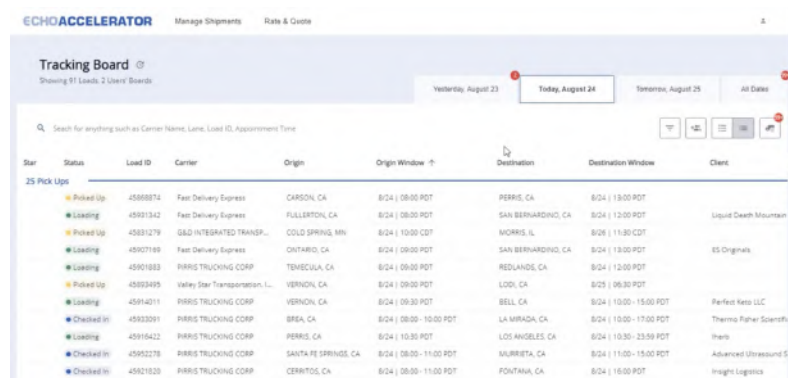

Echo's unique strengths: *Scale, Service, and Social Ties*

Notably, technology was referenced as more of a commodity than differentiator among peers in the same class as Echo.

What's the status quo?

When asked about how the current experience(s) stand on a scale of 1-10 (with 1 being essentially unusable and 10 being delightful), the responses were middling, with Accelerator and client-facing products leading in experience.

Overall

- "If usable but barely is 5, I would give us a **7**...it's slow, cumbersome, but it does a lot."
- "I'd give it a **7**, with the caveat that I don't have [much] day-to-day experience."
- "Depends on the day, but my initial reaction is a **6**."

Accelerator

- "Accelerator is...about a **7**"
- "Accelerator for truckload quoting is an **8**."
- "I'd give it a **6.5**, based on quoting."
- "**5** because of limited workflows right now...[but] they're thoughtful.. [Also], there's nothing illustrative about it."

Optimizer

- "In the **4-5** range, because it's old, outdated, and wasn't designed for truckload."
- "[Optimizer] is a **3**."
- "[Optimizer] is a **4** - the scrolling and clicking is overwhelming and there are multiple ways to do one thing."
- "**6** [because it] has colors."

Clutch

- "Looks cluttered, but you should really see how carrier reps [fly through] it."
- "Probably a **5-6**."
- "It gets a **7.5** because it has color [so] data jumps out."
