

Reps need to fight fires, not find them

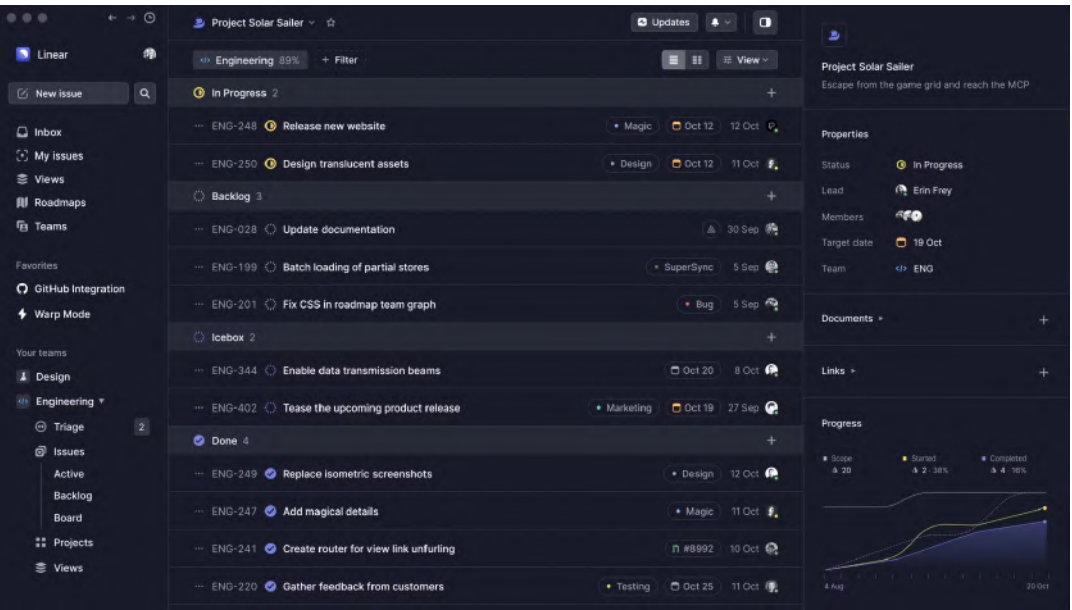

Solving for fewer *clicks*, less *scrolling*, and smarter *autofill* could shave seconds off each load.

But the forces tugging away from reps' time would not be addressed.

Across the board, an ideal day for both client and carrier reps is one spent not on the day-to-day quickly putting out fires, so that they can focus more on sourcing and closing deals.

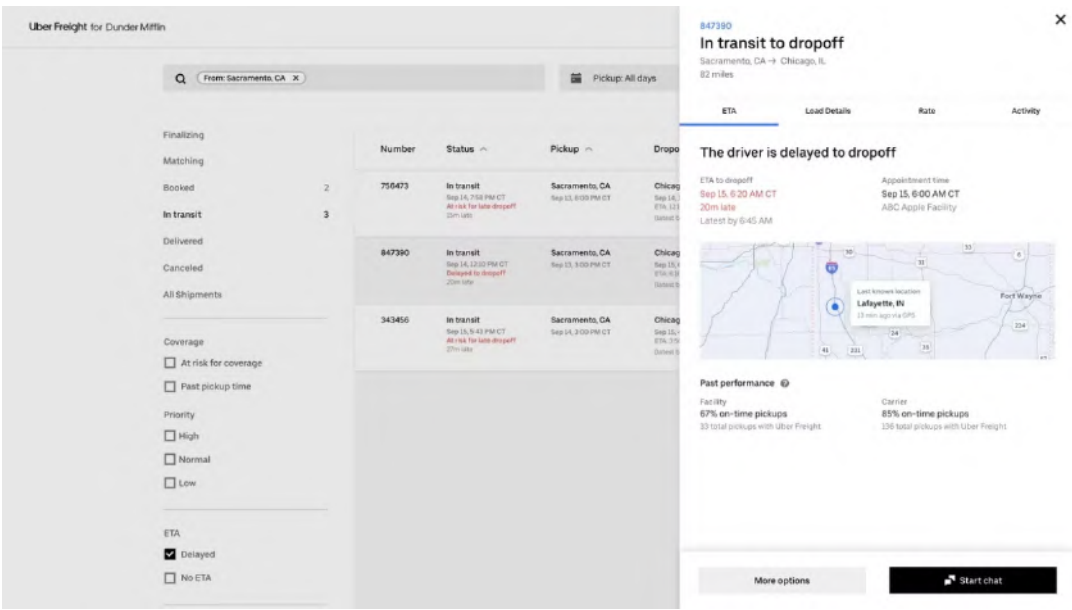

Not all of our pain points are unique

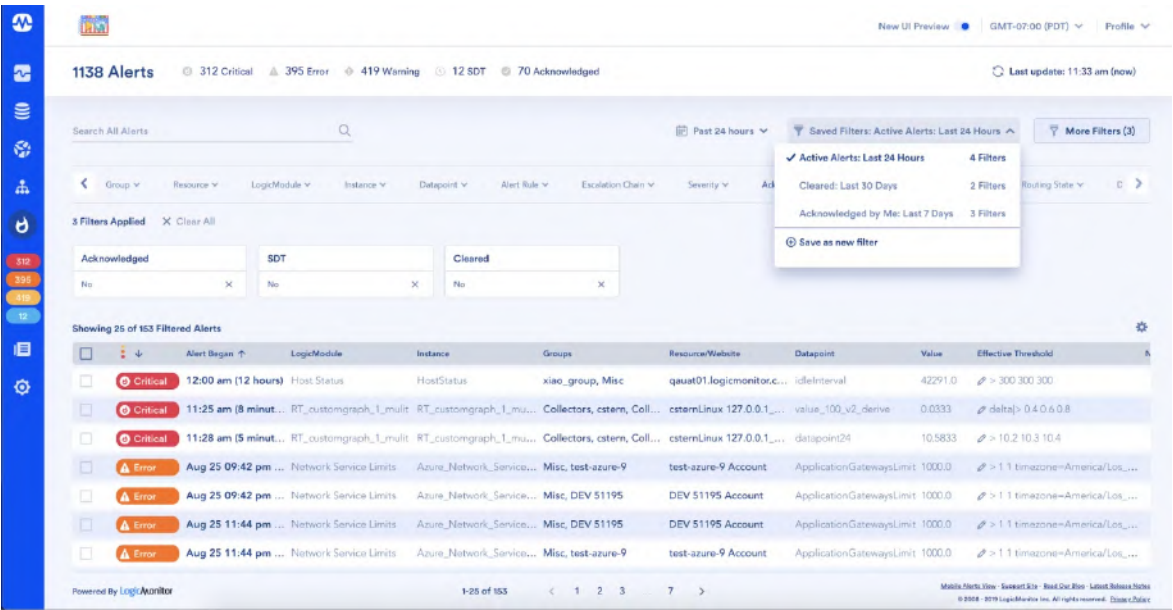

Multitasking & Prioritizing

- Prioritizing work and task building
- Customizing views of individual tasks
- Historical view of task list

Communication & Sharing Data

- Quick communication creates better and more expedient work
- Less 3rd party applications
- Sharing and discussing work (loads)

Notifications & Alerts

- Visibility into prioritized work
- Notification customization
- Deeply filtered

Creating a successful experience requires mitigating risks beyond the technical.

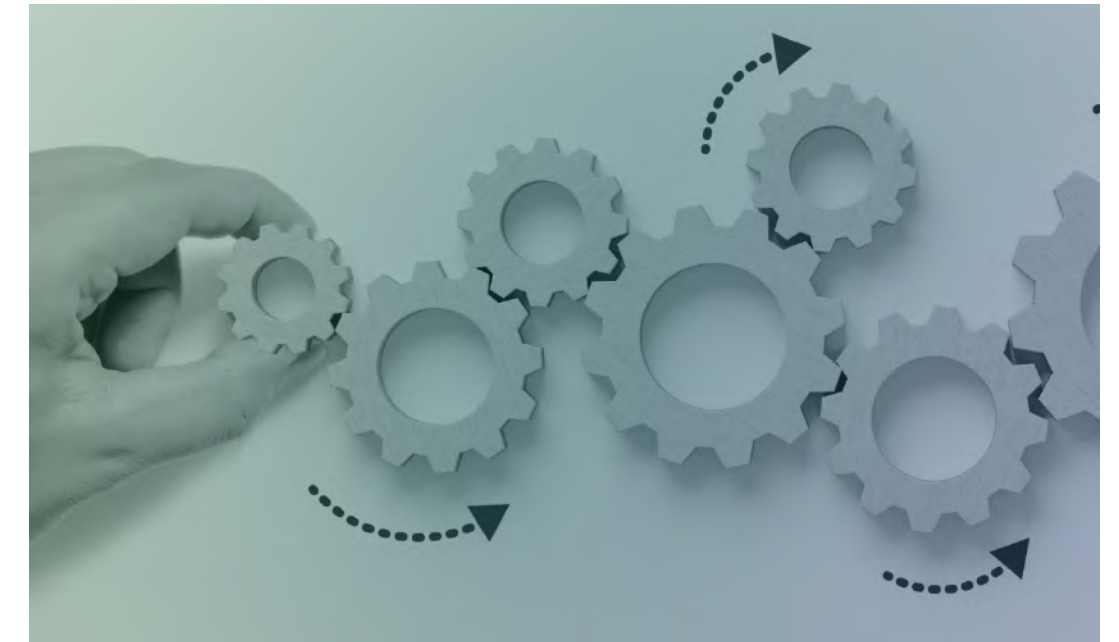

Process risks

- Product teams are under pressure to move fast, but face challenges in the form of things like technical debt and resistance to test-and-learn approaches like using MVPs and purposefully-incomplete prototypes to validate ideas and model impact

Automation risks

- Shifting the onus to identify priorities from the rep to the system can risk losing nuance in dynamic situations and lead to information overload
- Empowering reps with more detailed data is only valuable in so far as they use it.

Customization costs

- While concepts like automated workflows and saving/sharing load board views have definite merit, each one also creates an additional process to learn, run, and update.

Creating a successful experience requires mitigating risks beyond the technical.

General adoption

- While the subjective experience varies across platforms, and onboarding was cited as a major pain, for veterans who have built muscle memory around the existing experience changes are likely to slow them down (at first) which may temporarily lower impact on KPIs.

Workarounds

- Unless explicitly explored, workarounds like ignoring the offer board, not adding capacity, and "peeking" at upcoming loads on Stats may go away but will likely be replaced - what new behaviors will we be incentivizing?

Alerts & notifications were more contentious

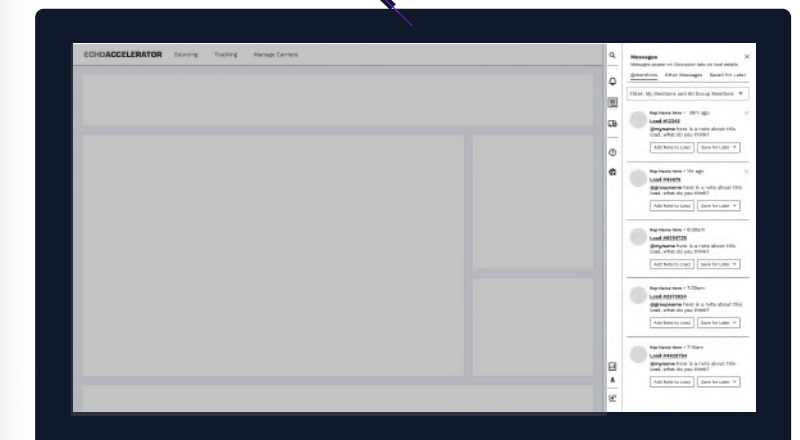

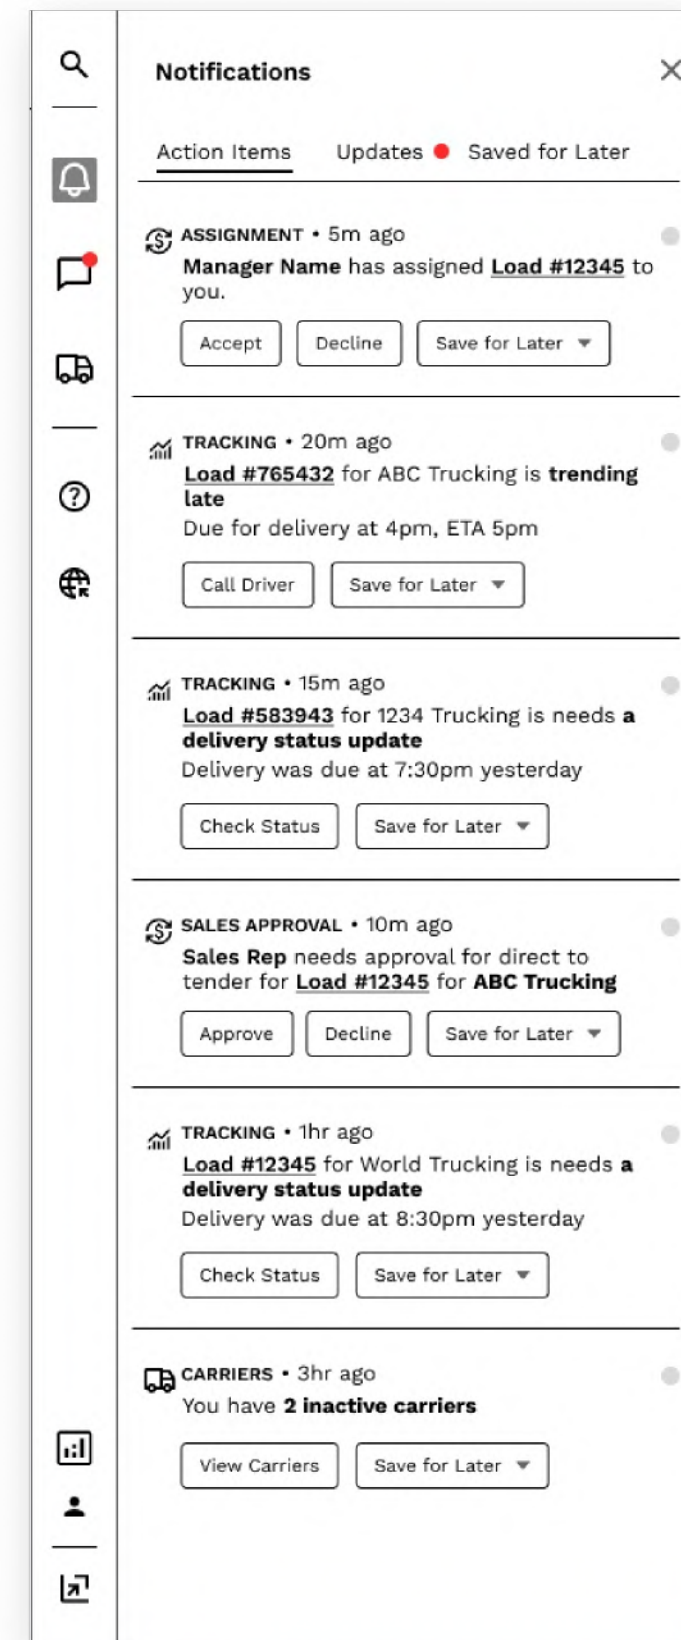

" I envision these action items, [especially tracking updates], hitting every 10 seconds. "

" You would have a feed of 300 action items for loads that need a delivery update. Currently the case system in Optimizer creates thousands of cases, which is just a flood that gets ignored. "

" Even for newer reps there are hundreds of things that need action on any given day. "

" We need an enterprise messaging service bus that triages any system that wants a user's attention to control pace, frequency, volume. "

" Alerts for new orders, but those come in every half second, so there needs to be some way to triage or manage this - e.g., a ticker. "

Today's alerts exist on extremes
