

How we keep reps informed & proactive

The new notifications and alerts types help the system keep reps informed, without interrupting flow unless absolutely necessary.

Dynamic alerts

Dynamic alerts are system messages that reflect the status of an action the user took back to them. They exist as a feedback mechanism, when user interaction wouldn't otherwise generate confirmation.

Urgency

Low

Triggers when

- A user has taken an action on the system and the system needs to reflect the status of that action

Goes away when

- Five seconds has passed for low importance alerts
- Ten seconds has passed or the user dismisses it for medium importance alerts
- The user dismisses it for high importance alerts

Examples:

1. A user has tried to save an order and there is an error in saving.
2. A user has submitted an order and the system let's them know it was done successfully.

Page alerts & table alerts

Page alerts and table alerts both draw the users' attention to an issue related to the content currently on the screen. While a table alert is tied to specific entries in a table component, the page alerts will show up on a detail view of the item in question.

Urgency

Low

Triggers when

- The system has identified an issue with an object
- The user is viewing a table that includes that object or
- The user is viewing the detailed view of that object

Goes away when

- The issues that triggered the alert is resolved

Examples:

1. Table: The rep is in a table view and a customer has an error on their account
2. Page: The rep is on a page view and a customer is missing specific data

The image displays two overlapping screenshots of the ECHOACCELERATOR web application. The top screenshot, labeled 'TABLE', shows the 'Order Board' with a 'Pending Orders' tab. A table lists orders with columns for Load ID, Customer, and Origin City. A red alert icon is visible in the top left of the table, and a tooltip message reads 'Resolve errors first to submit this order.' The bottom screenshot, labeled 'PAGE', shows the detailed view for 'Order 49292392'. It features a yellow alert box stating 'Cannot create a load with expected revenue that exceeds the customer's available credit.' Below this, account details and internal primary contact information are listed. At the bottom, a red alert box indicates '3 errors' with a list of specific validation failures: 'Pick 1: Phone number must be exactly 10 digits', 'Pick 1: Stop service window start date must be in the future', and 'Drop 1: Stop service window start date must be in the future'.

Stops

🔴 3 errors

- Pick 1: Phone number must be exactly 10 digits
- Pick 1: Stop service window start date must be in the future
- Drop 1: Stop service window start date must be in the future

Notifications

Notifications are informational items in the Notifications Panel of the Utility Bar. They occur when something important happens, but user action is not required. They help reps stay on top of various priority activity, opportunities, and status updates.

Urgency

Medium

Triggers when

- An important object in the system changes status
- "Important" is either business indicated or account/client indicated

Goes away when

- The user dismisses it
- A time limit is hit
- The situation that triggered it is resolved or otherwise no longer relevant

Examples:

1. A load for a important account gets booked
2. A client drops below a threshold on their credit
3. A tender is created and auto-accepted

Notifications with tasks

These are updates that require user interaction that also appear in the Notifications Panel of the Utility Bar. They are somewhat time sensitive and higher priority than Notifications (without tasks), but not as severe as Urgent Task Alert. They help reps keep track of high priority and impending exceptions and opportunities.

Urgency

High

Triggers when

- An important object in the system changes status and user intervention is required.

Goes away when

- The user resolves the task
- The situation that triggered it is resolved by someone else or otherwise no longer relevant

Examples:

1. Tender acceptance in a 3rd party TMS fails

2. Rep receives a new offer and they're not in the offers view

3. A truck in transit is delayed

Urgent Task Alerts

These are the most time sensitive, urgent, and important updates. They appear as a dialog overlay in the top right hand of the screen, not in the Notifications Panel, and steps to resolve can be taken directly from the alert.

Urgency

High

Triggers when

- There is an important issue related to an important client
- The issue requires intervention
- The intervention must be urgent

Goes away when

- The user takes action on the Alert itself

Carrier rep example:
If the user is locked into a load and another user FastPasses onto that load.
