

It's all

ABOUT DATA

DATA IN, DATA OUT

Data is holding Gale back

There's a lot to we need to consider about the data itself in order for Gale to position itself for a next step to a modern experience.

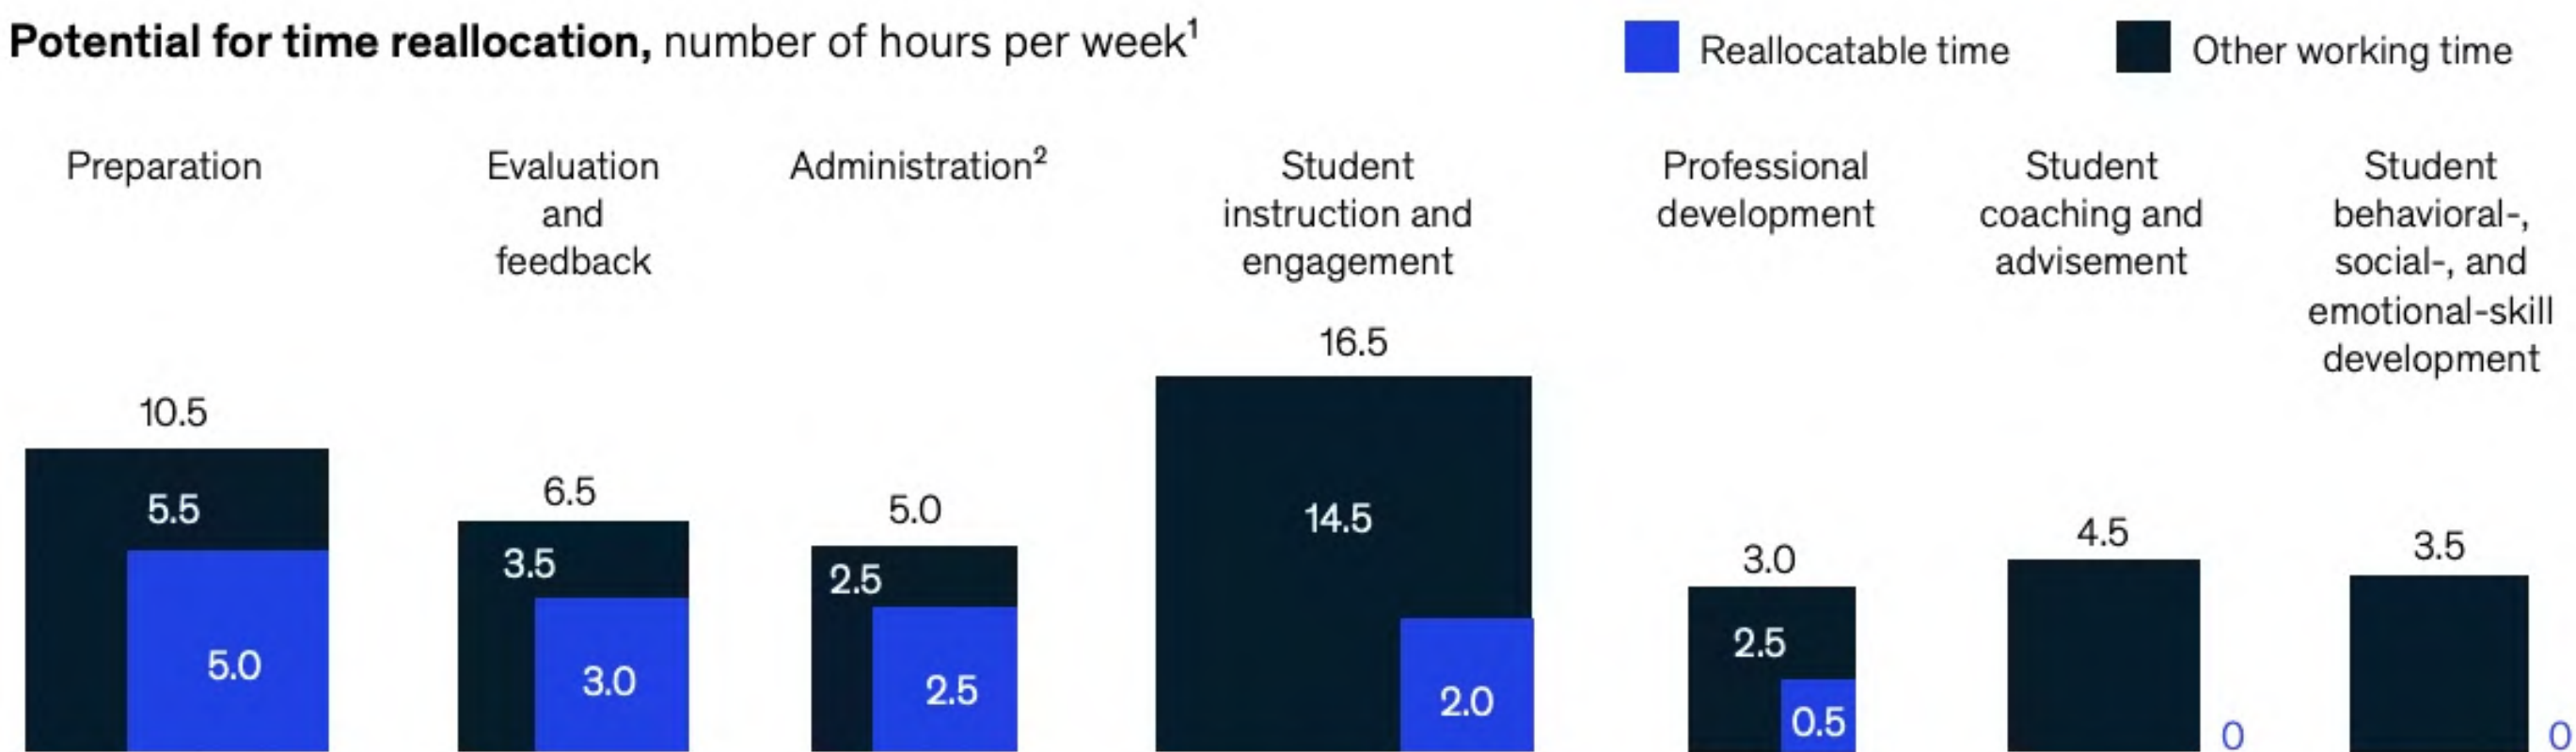

Gale's greatest asset is content. Making that content accessible and modular opens up a wealth of opportunities to integrate and leverage that asset in the market:

- Build new avenues for interaction and interoperability
- Engage and leverage outside services seamlessly
- Ensure data flows to other platforms with less friction and effort

Any future solution will need to know exactly how the data is sourced, stored, and structured, how it flows, how many systems currently touch it, and how it could potentially be accessed.

AI allows us to automate work, shifting the time teachers spend toward more meaningful and impactful work. ¹

Technology can help teachers reallocate 20 to 30 percent of their time toward activities that support student learning.

¹ Figures may not sum, because of rounding. Average for respondents in Canada, Singapore, United Kingdom, and United States.

² Includes a small “other” category.

Source: McKinsey Global Teacher and Student Survey

70% of teachers say the more meaningful part of their job is the top reason are still teaching. ²

AI feeds on complexity

AI is to education what the automobile was to transportation, city planning, and travel. There's a lot we can't predict right now. But there's one important thing we know. It's already here, and students and teachers are using it.

Myriad data types contribute to complexity in education data:

- aggregate test scores
- lexile levels
- fluency
- standardized test performance
- educational background data
- student characteristics
- pace
- engagement
- disciplinary data
- attention level
- socioeconomic data
- demographic data
- educator information

AI allows us to adapt resources based on data that tells us the needs of users. This leads to more usable resources, better search, and less friction when using the product.

...and outputs simplicity

AI unlocks capabilities that have long been considered pinnacles of pedagogy, and are actively raising the bar on ed tech solutions.

"AI will eventually touch every aspect of education. It has the potential to transform not only the education professions that we prepare students to enter, but also education itself. Ultimately, AI will be a key component to enable delivery of scalable and affordable quality education globally." ¹
