

Monetization

Balancing business, user, and partner needs.

Core question: How might we maximize business value without harming the experience?

Monetizing platforms afford us multiple levers to pull, including: take rates, subscriptions, pay-per-use, advertising models, and more.

Through AI Navigator, HP is positioned to be an *aggregator* of user demand and attention. The team needs to balance the diverse needs, values, and levels of willingness-to-pay against the overall experience of the product in order to create lasting, scalable success.

For each, we need to answer: what do we charge, whom, how, and when? Concurrently, we need to thoughtfully introduce monetizable surface area to the platform that adds, rather than erodes, value to the users.

New Platforms

Moving beyond the screen

Core question: How does Navigator adapt to shifts towards spatial computing, voice-first communication, and other emerging paradigms?

Our team should consider how we adapt the core experience and value of Navigator to additional modalities of interaction beyond text-in-text-out.

Beyond this, preparing for more immersive and future-forward paradigms, like XR, affords new opportunities to be considered and prioritized against business and user needs.

02

Product experiences

Progressive onboarding

From first-time to power users

Core question: How do we meet users where they are and guide them towards becoming AI power users?

We are all vain, lazy, and ignorant the first time we approach a product, so the way Navigator communicates its value is paramount. This is also an opportunity to start building in switching costs (via *customization*, *gamification*, and *personalization*), as we trade context from the user for a better experience.

The onboarding experience doesn't end after account set up and activation, though. There's a low floor, but high ceiling for AI-enabled skills and Navigator's ability to engender loyalty is in part a function of how well it can help users become more and more skilled.

Key considerations:

- How might we convince the user to share context?
- How might we communicate and drive adoption of new features, partners, and models?
- How might we mitigate known limitations of AI chat experiences?

Educational tracks

Lets users learn by doing

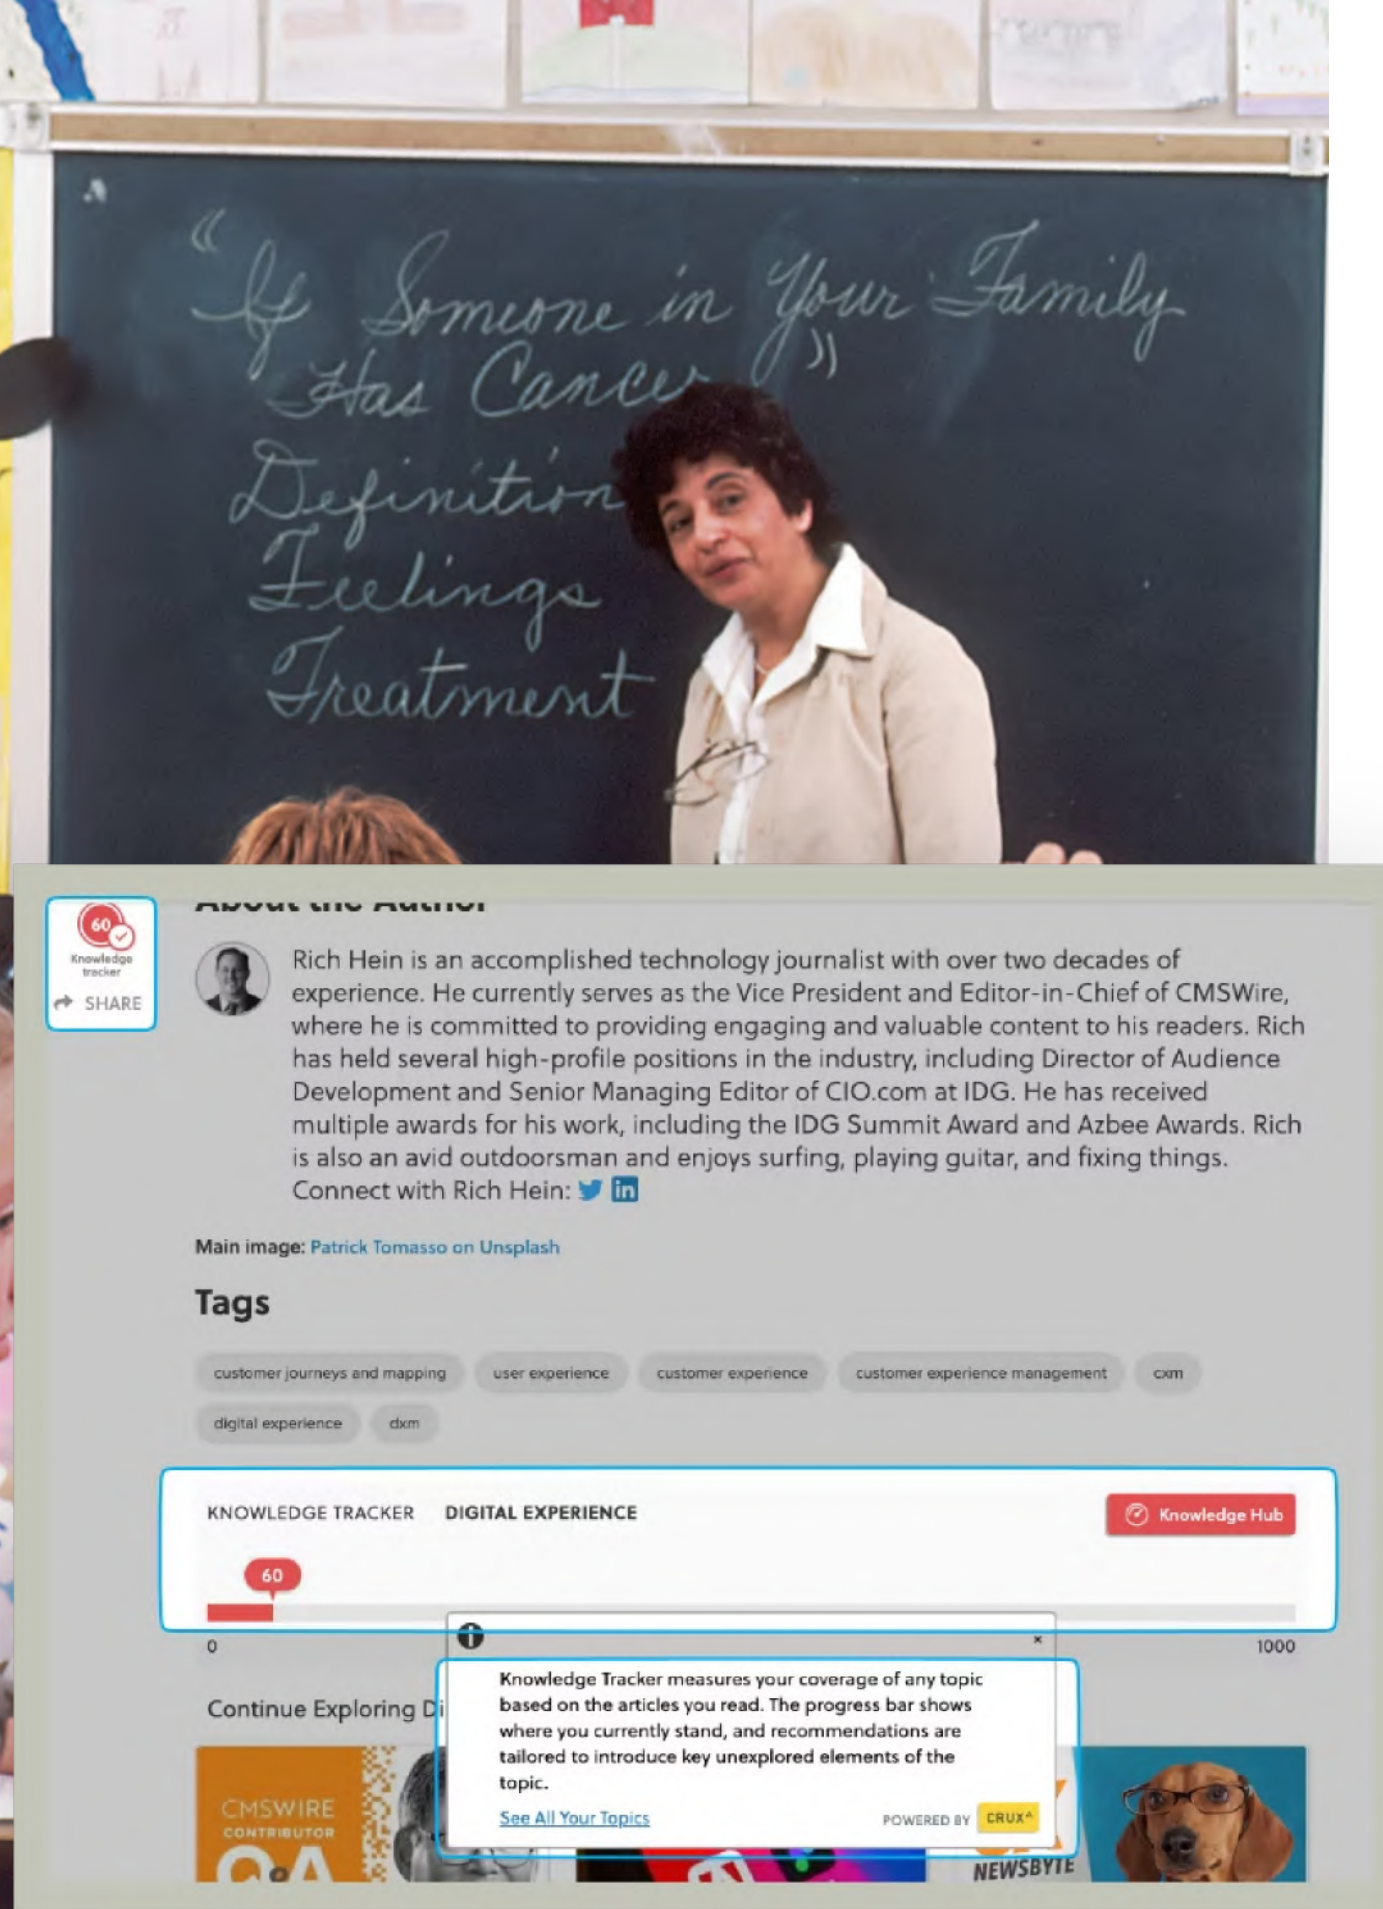

Core question: How do we create a differentiated and effective educational experience?

As part of positioning Navigator as a docent or mentor to introduce users to the world of AI, we've discussed at a high level the concept of educational tracks. But what do these look like?

Navigator is uniquely positioned to be able to create more structured, and gamified, "learn-by-doing" experiences that can map directly to goals that are relevant to your users' personal and professional lives.

Key considerations:

- HMW position this value to users?
- HMW surface this naturally in the experience?
- HMW build more habitual behavior around this?

Example dynamic learning track elements

Subtle ubiquity

Building a proactive toolbox

Core question: How do we blend the experience of Navigator into the rhythms and needs of your users' daily lives, such that it feels like an extension of themselves?

The best tools are out of sight and mind until you need them. Then, they're easily accessible without breaking the flow of your current task.

This feeling is achieved through two key principles: speed to access (and dismissal) and speed to context. The faster a user can bring up a tool *that has the context needed to be valuable*, the more natural the experience will feel.

Key considerations:

- HMW leverage keyboard shortcuts and natural language commands?
- HMW adapt the experience to various sizes?
- HMW give the assistant access to important context (eg, content on the screen, selected text, etc.)?

Example dedicated widgets
