

Memory

Truly personalized assistants

Core question: How might we help deliver on the personal assistant experience?

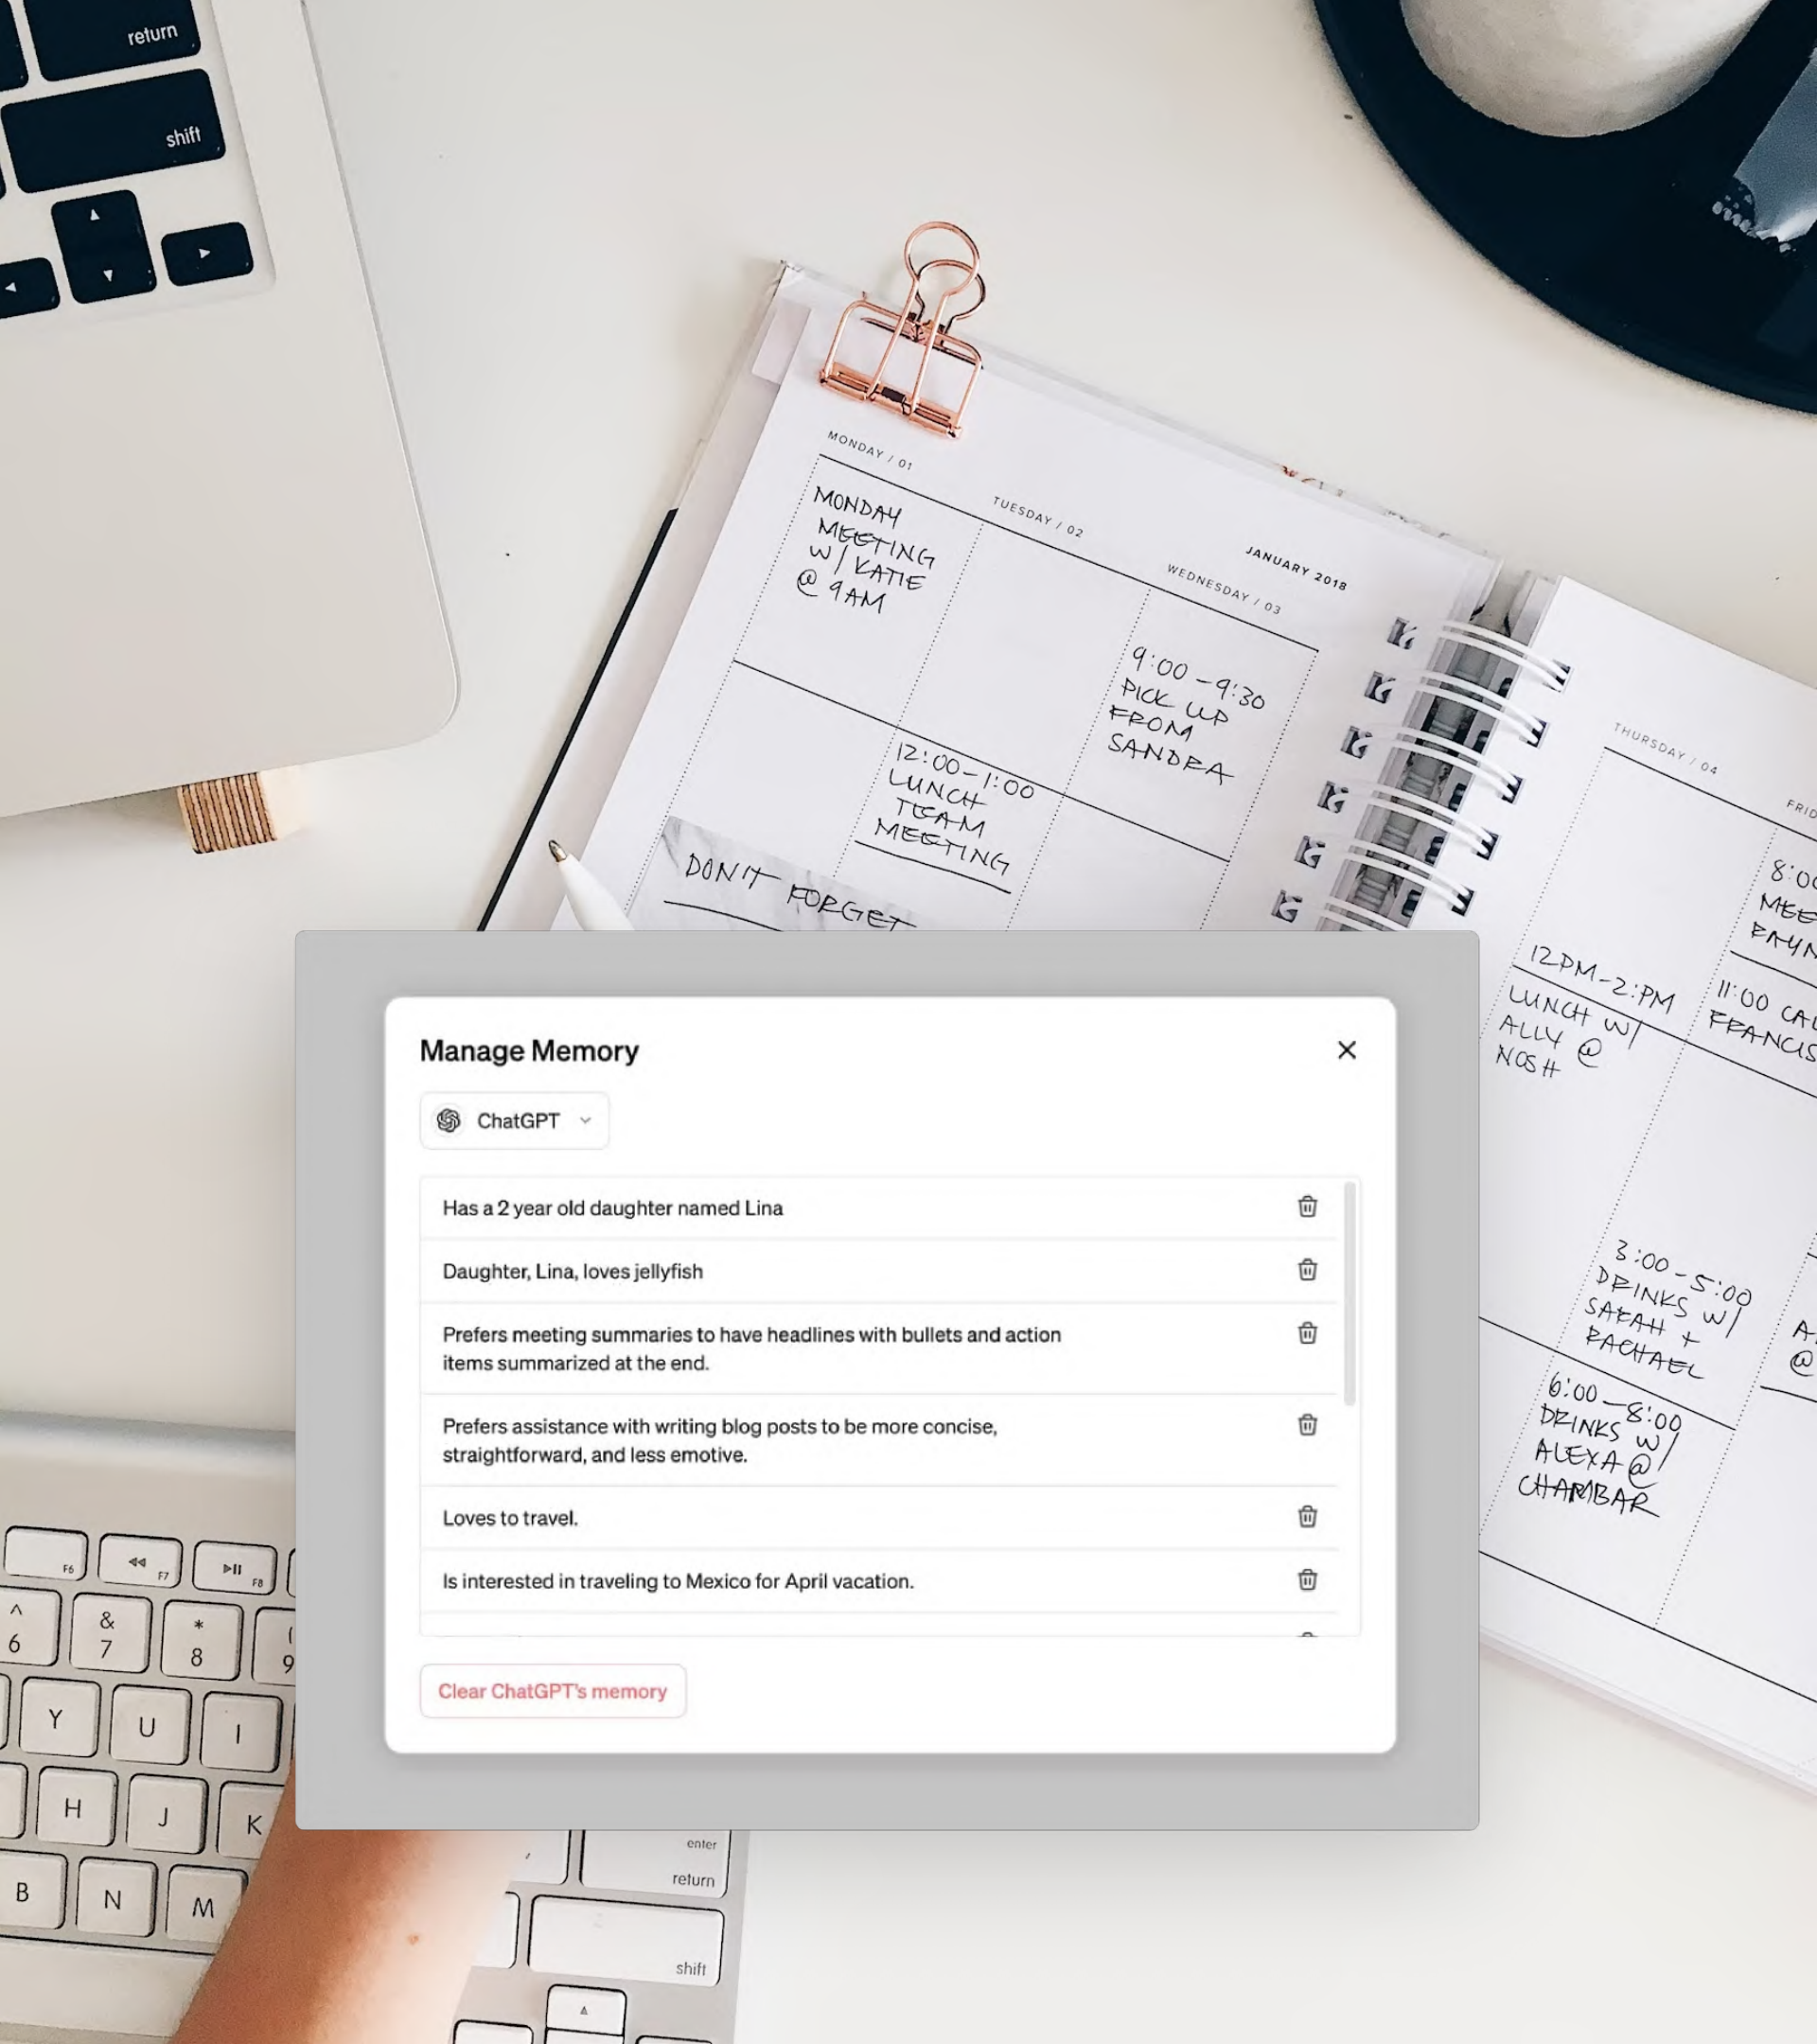

Currently, chatting with agents is like walking into your office and having no one remember who you are.

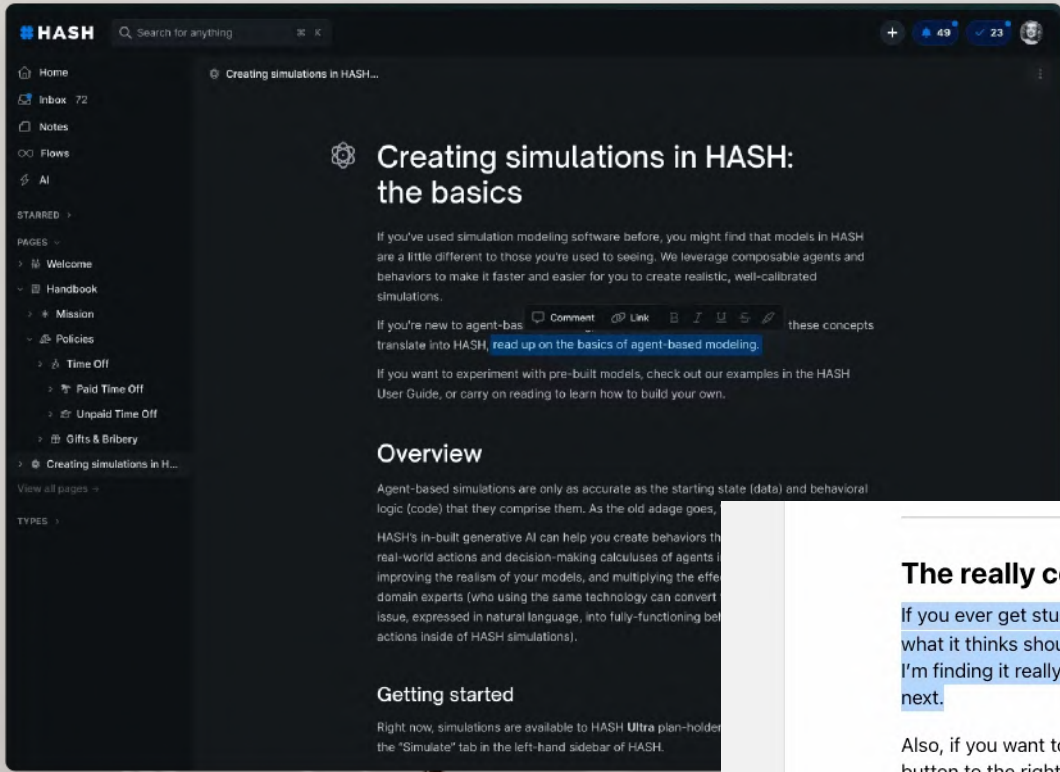

As context windows expand, opportunities to simulate long term memory for agents are created. This is a key step in delivering more *reliable* and *exceptional* assistant experiences.

Notably, this is as much a question about trust as it is a technical and experiential consideration.

Key considerations:

- HMW identify the right information?
- HMW manage limited context windows?
- HMW ensure users feel appropriately in control of this functionality?

The really cool thing is the AI, though

If you ever get stuck, just hit `command+enter` or type `+++` and GPT-3 will fill in what it thinks should come next. Sometimes it outputs rubbish, but personally, I'm finding it really helpful to get me unstuck when I'm not sure what to write next.

Also, if you want to generate title ideas based on your document, just click the button to the right of the title of the doc. It'll ask the AI to come up with some options.

Another cool feature is the AI roadmap: rephrase a sentence, generate a summary, and more.

as here!)

Workspaces

An AI-native work suite

Core question: Should we build AI-native content creation and editing tools?

Companies like Google, Microsoft, and Notion are racing to maintain or expand their market position for their work tools by incorporating more and more AI-enabled features and functionality.

There's a large opportunity - as well as large competition. We need to consider whether this is a race worth competing in, and how we might medal.

Key considerations:

- What unique value can we add to this workflow?
- How might we mitigate competing directly with partners?
- What does an AI-native workspace look like?
- HMW support teams working together?

03 | Refinement

Optimizer

The following questions were noted as important for the team to follow up on:

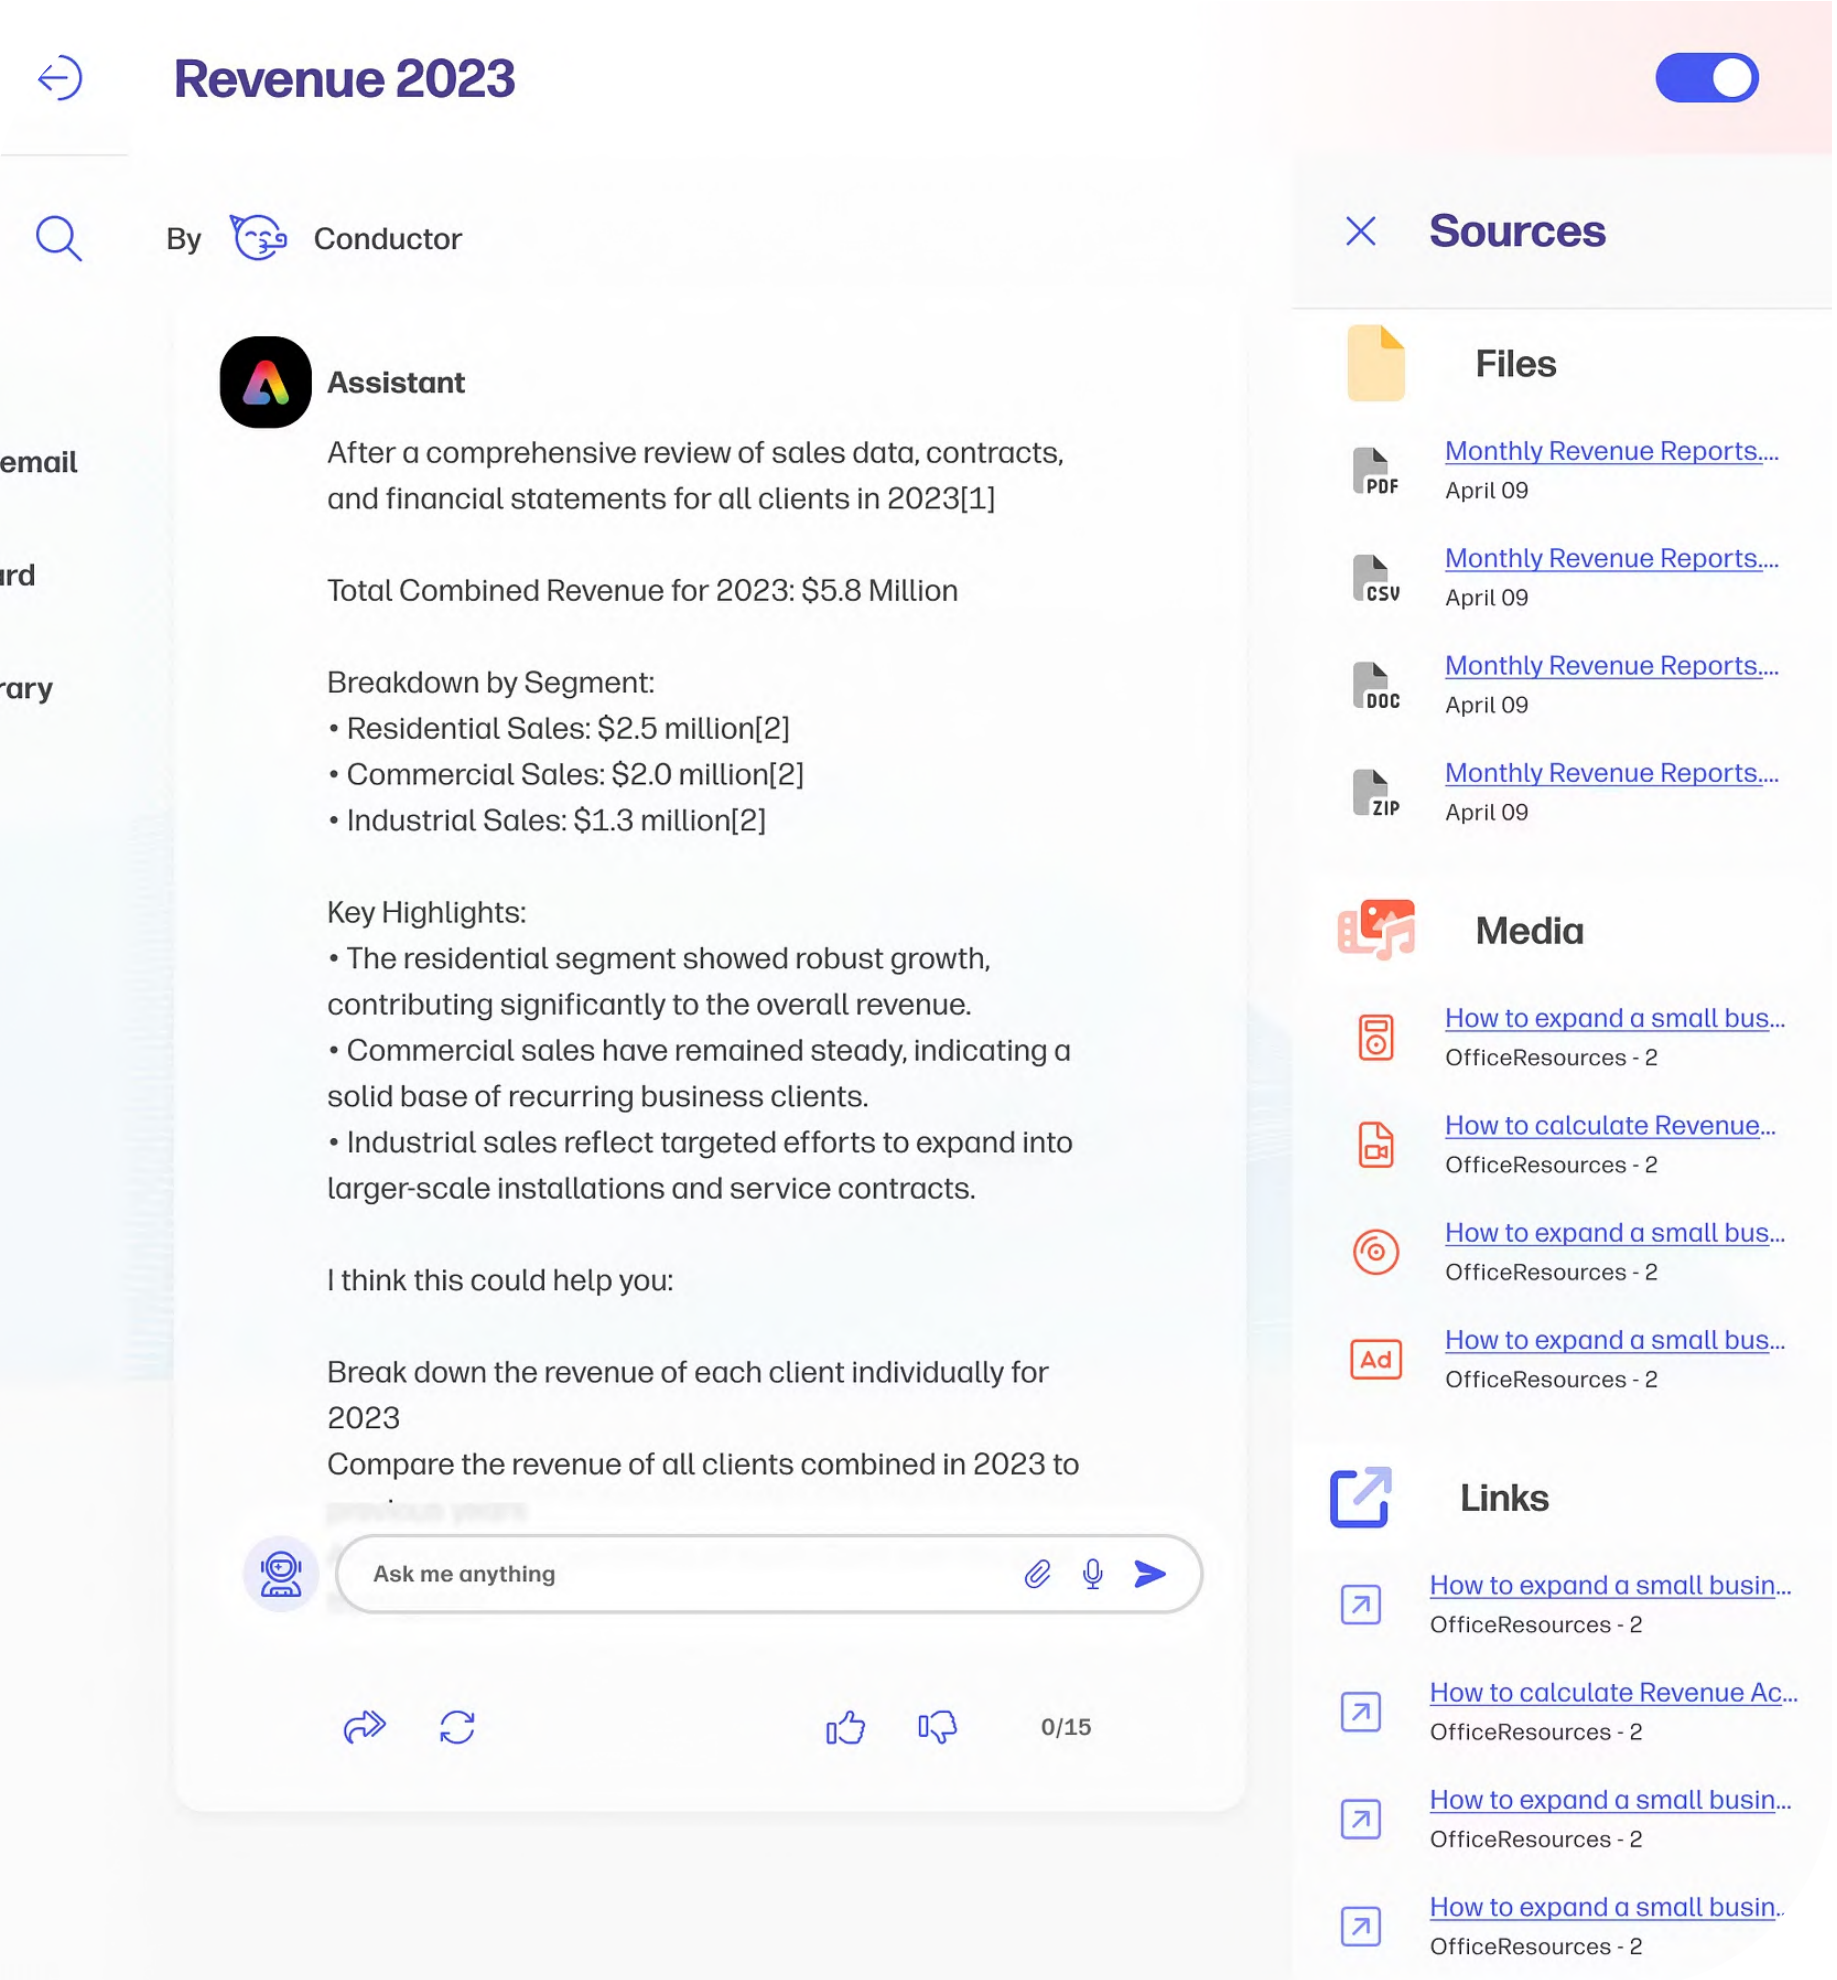

- What might more advanced controls and customizations look like?
- HMW push recommendations to users?
 - How might this be fluidly incorporated into a top-level notification feed?
- Does generative UI obviate the need for a dashboard?
- What does a flow that includes executing recommendations look like?

Chat responses

The following questions were noted as important for the team to follow up on:

- HMW mitigate the feel of long load times?
- HMW communicate hallucination risk?
- HMW give users more control over their past conversations (filter, pin, rename etc.)
- HMW incorporate multiple agents into a single conversation?
- What is the prompt iteration or refinement workflow?
- Should we communicate or show the "work" the agent completes in between responses?
- HMW show images, graphs, and other graphics?

NOTED REFINEMENT NEEDS

Discovery

The following questions were noted as important for the team to follow up on:

- HMW elevate goals/capabilities/workflows vs. tools?
- HMW leverage this to build a community, with user generated content?
- HMW enable quick trial experiences?
- How should users interact with the content from the News & Information feed?
- HMW incorporate ISV partner recommendations directly into conversations?
- Should there be a Discovery agent that lives in the agent selector screen?
